Boosting Data Governance with Rocket® Data Intelligence™

GROUPE PASTEUR MUTUALITÉ

Groupe Pasteur Mutualité (GPM) is a specialized insurance provider for medical professionals and insures 138,000 healthcare workers. Founded in 1858, GPM is a global player in the protection, support, and well-being of caregivers to facilitate their specific professional needs. GPM is headquartered in Paris and employs over 450 people.

Challenge

As an established leader in their field providing vital services to healthcare professionals throughout France, data quality is at the core of GPM's business operations and has a major impact on activities that include portfolio assessments and a range of other calculations. Countless aspects of the business, and the decisions made by leadership, hinge on having data that is accurate and trusted by those that need it.

Over time, the task of ensuring data quality grew more complex, particularly with new European Union compliance standards. In 2019, ACPR, an administrative authority responsible for monitoring banks and insurance companies in France, conducted a study that looked at data quality from 193 French insurance institutions and found that companies reported significant gaps in data lineage.

Subsequently, GPM realized the need to modernize its data governance capabilities to ensure that business decisions were made with the best quality data and to remain up to date with the latest regulatory standards. Doing this meant achieving a greater understanding of its data lineage and better control of data flow throughout the organization.

The Challenge

GPM needed to efficiently get a handle on data lineage to improve operations and remain compliant.

> On the one hand, data whose quality is controlled allows us to strengthen our regulatory compliance by producing reliable regulatory reports. On the other hand, good quality data allows us to reduce correction costs. Thanks to Rocket Data Intelligence, GPM was able to strengthen its regulatory compliance and reduce management costs inherent to poor data quality."

ANAS TAUD
Chief Enterprise Architect & Chief Data Officer

Solution

As GPM set out to identify the right solution to achieve its goals, the company focused on two priorities. They required a solution that could both reduce costs related to governance and deliver features uniquely suited to match its ongoing business operations. After engaging on a proof of concept with Rocket Software, GPM chose Rocket Data Intelligence to achieve its objectives and overhaul the company's data governance capabilities.

Having been in business for over a century, the technology stack at GPM had multiple layers that had built up over time. Rocket Data Intelligence made integrating those layers quick and easy, creating the groundwork for truly comprehensive data lineage across operations. The solution infuses critical flexibility and adaptability into operations, supporting a broad scope of technologies that encompass everything from COBOL and AS400 to SQL and Oracle®. When implementing the solution, GPM leveraged regulatory and customer subscription processes to develop a roadmap for data lineage.

After successfully building its roadmap, GPM was able to look at the outcomes within the model and refine the model to further meet its needs. In creating and honing this metamodel, GPM was able to better use the features of Rocket Data Intelligence to achieve data lineage on a wider scale for business and technical users alike.

The Solution

GPM created a highly detailed data lineage for its most important business data with Rocket Data Intelligence.

Results

With digital transformation projects, when data starts to move from environment to environment, businesses run the risk of experiencing a loss of data accuracy, completeness, relevance and consistency, with significant consequences on the calculation of regulatory reports and on costs of corrections. By implementing Rocket Data Intelligence, GPM controlled the data scope in an exhaustive and dense manner. Rocket Data Intelligence's features enabled GPM to stand up its own business data glossary and linage that acted as a "convergence roundabout" for both business and IT stakeholders.

Rocket Data Intelligence also allowed GPM to centralize knowledge of data and data flows which were scattered in the brains of several business and IT players. The organization was also no longer dependent on the knowledge of retiring workers who have accumulated unique expertise in legacy systems.

With Rocket Data Intelligence, GPM improved access to business data throughout the organization, enabling business users to tap into the right data to conduct analysis, gather insights, and optimize operations beyond the technical side. It served as a democratizing force for users' enterprise wide.

In addition to optimized maintenance and improved data access and quality, the boost to data visibility and accuracy from Rocket Data Intelligence has also benefited regulatory compliance as well. With up-to-date technical documentation of data flows and stronger governance processes, GPM can confidently access any data it needs for reporting purposes.

## Rocket Software's impact on Groupe Pasteur Mutualité:

Insight data

A dense and exhaustive lineage allows the customer to control the quality of raw and calculated data from end to end.

Cost Savings

Reduced the time, money, and resources dedicated to maintaining data quality operations.

Convergence

The streamlined data lineage and business glossary foster unified communication between business and technical users.
